

Introduction Lab

Congratulations! You and your partners have just been hired by Northwind Traders, a restaurant supplier to build the warehouse management system (WMS) for their burgeoning business!

They've been

1. keeping track of inventory,
2. shipping product,
3. and receiving new product into their small warehouse

all by hand! Their growth has taken them to the point where they need to automate.

Let's get started!

Make sure node and npm are installed

1. Run this command:

```
node --version
```

2. Did you see a version number? If so, you have npm installed and you can skip to "Make sure Angular CLI is Installed". If not, go to the next step.
3. Point your browser at <http://nodejs.org>
4. Click the download button on the main page. Choose the one recommended for most users; it will be the stable release.
5. Follow the instructions to install it on your machine. This will install both npm and node.
6. Rerun your `node --version` command to make sure it is installed alright. If you get command not found, you should probably reboot so make sure your PATH has been reread.

Make sure Angular CLI is installed

7. Run this command:

```
ng --version
```

8. Did you see a version number? If so, you have the Angular CLI installed and you can skip to "Make sure MongoDB is Installed". If not, go to the next step.
9. Open a bash window as an administrator and run this command

```
npm install --global @angular/cli
```
10. Rerun your `ng --version` command to make sure it has installed properly.

Make sure MongoDB is installed

11. Run this command:

```
mongod --version
```

12. Did you see a version number? If so, you have MongoDB installed and you can skip to "Download the starter files". If not, go to the next step.
13. Point your browser to mongodb.com/download-center. Choose to install MongoDB Community edition. Choose your OS and follow the instructions to install.
14. You may need to add the install directory to your path and restart.
15. Rerun your `mongod --version` command to make sure mongo installed properly.

Download the starter files

16. Point your browser to the site your instructor gives you to download and install the starter files.
17. Take a look around the directory structure. You should see these directories:

instructions	Will eventually hold each lab's instructions
setup	Files and commands to load the database. Some code snippets.
webServer	The server-side code which is pre-written for you. Feel free to look and see how node, express, and mongo work together.

Install needed libraries

18. cd to the setup directory and run this command in the bash shell

```
./installLab.bash
```

This will install the libraries needed for the node/express/mongo web server.

Testing the web server

Every time you run the warehouse webServer we should have the Mongo database server running.

19. Open a bash shell and type this in

```
mongod
```

Please keep mongod running every time you want to get to the server's Ajax endpoints.

20. Now start the web server. Open a new bash shell and run this command:

```
node warehouseServer
```

It will tell you it is listening on a particular port, usually 3000.

21. Try a few of these addresses:

```
localhost:3000/api/products
```

```
localhost:3000/api/locations
```

```
localhost:300/api/orders/10250
```

If you can see data, you are up and running! You can be finished with this lab.
